Phosphide Eutectics in Cast Iron

SOV/32-25-6-21/53

visible (the free one with respect to structure, as well as the one in ledeburite, and the one penetrating the ternary phosphide eutectic), while with the second pickling the phosphide of the binary and ternary eutectics becomes visible additionally. A few microstructure pictures of these picklings on cast iron are shown (Fig 2). There are 2 figures and 1 table.

TITLE:

Separated Film Pickling of Binary and Ternary Phosphide Eutectics in Cast Iron (Razdel'noye plenochnoye travleniye dvoynoy i troynoy fosfidnykh evtektik v chugunakh)

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 6, pp 705-707 (USSR)

ABSTRACT:

To work out a method of differentiating visualization of binary and ternary phosphide eutectics, chemical and electrolytic picklings were carried out on the systems Fe - P, Fe - C and Fe - C - P. Experimental results obtained were applied in investigations of the structure of white iron and gray iron (with different contents of carbon and phosphorus). The results of various pickling operations as well as the composition of the pickling agents and the pickling conditions are specified (Table). An electrical pickling in a neutral solution of potassium ferricyanide at 6 v for 30-50 sec and a subsequent electrical pickling in an alkaline potassium ferricyanide solution at 3 v for 10-15 min (or chemical pickling for 15-25 min) are regarded as the most suitable method of visualizing the binary and ternary eutectics in cast iron. The first pickling renders cementite

ABSTRACT: A method was developed by which the carbide and the intermetalloid phases of various alloying elements can be differentiated according to their "ultraviolet colors." The procedure was applied to the structure study of complex alloys on an Fe-Cr-Ni base. The metals were investigated after casting and after hardening and aging. The casts contained austenite, ferrite, and an intermetalloid phase (in alloys free of carbon), or a carbide phase (in alloys containing carbon). The ferrite decomposition took place in the process of aging

TITLE: Preparation and use of blood from convalescent animals for foot-and-mouth disease

SOURCE: Veterinariya, no. 3, 1966, 40-42

TOPIC TAGS: foot and mouth disease, blood, epizootiology, experiment animal, preventive medicine, animal disease therapeutics

ABSTRACT: A total of 7,821 cattle and 1,400 swine were inoculated with blood obtained from animals convalescing from foot-and-mouth disease. The results were best in calves up to one month old when the dose was 2.5-3 ml per kg of animal weight. Very few of the animals contracted the disease even in the midst of an epizootic. And in the few that did the course was very mild, with the animals having a normal temperature and good appetite. In most cases the inoculations halted the outbreak.

The blood of convalescent animals was also administered to very sick adult cows and bulls in doses of 500-600 ml and 700-800 ml, respectively. The course of the disease was much milder and recovery took place sooner than in the control.

Thus, the use of blood from animals recovering from foot-and-mouth disease has both prophylactic and therapeutic value. Orig. art. has: 2 figures. [SPRS]

from 515°C and the Al-0.8% Mg-0.65% Si from 520°C; for alloy V95, same as above, except that different EDP temperatures were maintained. For D1T the treatment was the same as for the aluminum, except that quenching was at 500°C. The tensile properties for Armco iron after treatment are listed. The change in energy EDP did not affect the properties. EDP (especially at 70°C) raised both strength and hardness and caused a sharp decrease in specific electrical resistivity. These property changes were noted only after 1 day or more of natural aging. No differences could be observed between EDP and the usual quench and age treatment. The results for the aluminum alloys were similar in some respects. However, after aging for 15 days a significant lowering of hardness and an increase in impact energy was noted following EDP. The authors concluded that EDP in normally quenched alloys, and quenching in a field of electrical discharges, speeds up the decomposition process in the primary period of aging (to 1 day) but that after 5 days of aging the properties are almost identical. In some alloys, after 15 days of aging, a significant lowering in properties can be observed (strength, hardness). In dispersion hardening systems, the only effect observed was in the primary stages of aging. Orig. art. has: 5 figures, 2 tables.

SOURCE: Leningrad. Politekhicheskiy institut. Trudy. no. 251, 1965. Metallovedeniye (Metal science), 62-69

TOPIC TAGS: aluminum alloy, iron, dispersion hardening, *solid mechanical property, electric resistance, metal aging, electric discharge*

ABSTRACT: A study was made of electric discharge processing (EDP) in water and its impact on aging behavior in Armco iron, aluminum alloys--Al-Cu² and Al-Mg-Si¹ and the alloys D11 and V95. ¹⁰ Tensile properties, hardness, impact energy, specific electrical resistance and microstructures were analyzed after various treatments. EDP was applied as follows: for Armco iron: (1) quench from 700°C (1 hr hold time) into water and natural aging for 1, 5 and 15 days; (2) same quench with supplementary EDP at room temperature immediately after, and after 1 and 5 days; (3) same quench with artificial aging at 50°C for 4 hrs; (4) same quench with EDP done at 70°C. For the aluminum alloys: similar EDP treatments and aging schedules, except that Al-3% Cu was quenched

Electropolishing of metallographic sections of steel or cast iron in orthophosphoric-sulfuric acid electrolyte. *Zaytskaya L.P., Izv. Akad. Nauk SSSR, Metalloved. i Metallofizika, 1964, No. 1, p. 104.* The H₃PO₄-H₂SO₄ electrolyte, containing no H₂SO₄, is found to be well adapted for electropolishing of steel and alloy steel and of cast iron. The electrolyte is very stable and requires no special treatment. The appearance of steel and cast iron, as revealed by etching in this electrolyte, is similar to Na picrate etching, with the cementite appearing black. With this electrolyte, polishing with cut polishing produces only slight etching (except in austenitic steel and hardened steel). Intensive stirring results only in polishing. The structure of such polished samples can be revealed either by the usual chem. etching or by etching in the electropolishing electrolyte at 2-3 amp./sq. dm.

and undergo hydrolysis. All three compounds are insoluble in alcohol, ether, and acetone. The solubility of cesium uranyl fluoride complexes in H_2O increases in the order $CsUO_2F_3$, $CsUO_2F_3 \cdot H_2O$, $Cs_2UO_2F_4 \cdot H_2O$, $Cs_3UO_2F_5$. $Cs_2UO_2F_4 \cdot H_2O$ forms in vacuum evaporation of 0.63 M UO_2F_2 and 6.08 M CsF solutions at the molecular ratio of 1:2. $CsUO_2F_3 \cdot H_2O$ forms in slow evaporation of these solutions in the air. $Cs_2UO_2F_4 \cdot H_2O$ forms in slow evaporation of saturated UO_2F_2 and CsF solutions at the molecular ratio of 1:2 in the air. At the molecular ratio of 1:1, $CsUO_2F_3$ readily precipitates only from concentrated UO_2F_2 and CsF solutions; diluted solutions give a mixture of $CsUO_2F_3$ and $CsUO_2F_3 \cdot H_2O$. The interplanar spacings of the crystals $CsUO_2F_3$, $CsUO_2F_3 \cdot H_2O$, $Cs_2UO_2F_4 \cdot H_2O$, and $Cs_3UO_2F_5$ were calculated and the wavelengths of the principal absorption bands were measured; these range between 4200 and 6000 Å. There are 8 figures and 8 tables.

TITLE: Production and properties of some uranyl fluoride complexes

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 7, no. 7, 1962, 1538-1547

TEXT: The precipitates formed in the reaction between 6.08 M CsF solution and 0.63 M UO_2F_2 solution were investigated in the range of concentration (C) $[\text{Cs}^+ : \text{UO}_2^{2+}] = 0.5 - 20$ by means of absorption spectroscopy, X-ray analysis, and chemical analysis. Three Cs-UO₂-fluoride complexes were formed: CsUO_2F_3 at C = 0.5 - 1.5; $\text{Cs}_2\text{UO}_2\text{F}_4 \cdot \text{H}_2\text{O}$ at C = 2-3; $\text{Cs}_3\text{UO}_2\text{F}_5$ at C = 6 - 20 and a mixture of $\text{Cs}_2\text{UO}_2\text{F}_4 \cdot \text{H}_2\text{O}$ with $\text{Cs}_3\text{UO}_2\text{F}_5$ at C = 3 - 5. CsUO_2F_3 is a finely crystalline, yellow substance soluble in diluted HNO_3 , poorly soluble in H_2O ; it hydrolyzes in aqueous solution. Both $\text{Cs}_2\text{UO}_2\text{F}_4 \cdot \text{H}_2\text{O}$ and $\text{Cs}_3\text{UO}_2\text{F}_5$ form green crystals, are soluble in H_2O .

TITLE: Properties of plutonyl fluoride complexes

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 6, no. 7 1961, 1513-1519

TEXT: The object of the present study was the production and investigation of plutonyl fluoride complexes with alkali metals. The systems $\text{PuO}_2\text{F}_2 - \text{MeF} - \text{H}_2\text{O}$ with $\text{Me} = \text{Na}, \text{K}, \text{NH}_4, \text{Rb}, \text{Cs}$ were investigated in the range $\text{Me}/\text{Pu} = 1$ to 50 by means of electron absorption spectra. The latter were recorded by means of the WDR-51 (ISP-51) spectrograph at the boiling temperature of liquid nitrogen. The compounds prepared were analyzed; Table 1 provides a list of the compounds produced as well as the analytical values. The compounds $\text{MePuO}_2\text{F}_3 \cdot \text{H}_2\text{O}$ are isotopic and of cubic symmetry.

Fig. 2 shows schematically the powder diagrams, obtained in the RKU-86 (RKU-86) camera with chromium radiation, for the following compounds (lattice constant in brackets): $\text{KPuO}_2\text{F}_3 \cdot \text{H}_2\text{O}$ (9.126 Å), $\text{RbPuO}_2\text{F}_3 \cdot \text{H}_2\text{O}$

Separation and Investigation of the Physico-chemical Properties
of Plutonyl-chloride (Vydeleniye i izucheniye fiziko-khimicheskikh svoystv khloristogo plutonila)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 5, pp 961-962
(USSR)

ABSTRACT:

The synthesis of plutonyl chloride was carried out by the vacuum vaporization of a plutonyl chloride solution at room temperature. Plutonyl chloride was isolated in form of greenish-yellow crystals of the composition $\text{PuO}_2\text{Cl}_2 \cdot 6\text{H}_2\text{O}$. By means of electrons and infrared absorption spectra of the plutonyl chloride crystals it was proved that this compound contains PuO_2^{2+} ions and that no Pu(IV) is present. The spectra of the crystals were photographed by means of the spectrograph ISP-51 (the camera had a focal length of 270 mm) within the range of 4200 - 9800 Å. After a longer storage of the plutonyl chloride preparation the infrared and electron adsorption

COVERAGE: The book contains 26 separate studies concerning various aspects of the chemistry of certain radioactive elements. The book is divided into two parts. The first part of the book discusses the processes of radiation effect on matter. These reports discuss present-day knowledge of the processes of irradiation of organic compounds, polymers, and inorganic compounds. The second part of the book discusses the chemistry of many of the most interesting radioactive elements, including uranium, plutonium, and americium, problems related to the separation and burying of radioactive wastes, the radiolysis of aqueous solutions and of organic compounds, the mechanism of polymer chain degradation and of radiation on natural and synthetic rubber. The bibliography cited in the book is extensive. Most of the reports are accompanied by references. Contributions to individual investigations are mentioned in annotations to the Table of Contents.

TITLE: The Production of Plutonium Tribromide and Some of Its Properties
(Polucheniye i nekotoryye svoystva tribromida plutoniya)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1958, Vol 3, Nr 10, pp 2231-2235
(USSR)

ABSTRACT: The spectra of absorption of solid plutonium tribromide were taken at the temperature of liquid nitrogen. A method was described according to which plutonium tribromide can be produced by acting HBr on plutonium (IV)-oxalate at a temperature of 500°C. The specific weight of plutonium tribromide thus produced is 5.54 ± 0.02 . The density of plutonium tribromide depends on the composition of the compounds which are treated with HBr. The values vary between 5.0 g/cm^3 and 5.8 g/cm^3 . The hygroscopic properties of plutonium tribromide were analyzed and it was found that the bromide does not show a perceptible moisture absorption after it has been kept over sulfuric acid for 7 hours. The existence of two crystal hydrates of PuBr_3 was found and their spectra of absorption were taken. It was found that PuBr_3

Investigation of the Physico-Chemical Properties of Plutonyl Fluoride

The electron and U.R. absorption spectra of plutonyl fluoride proved the presence of the PuO_2^{2+} -ion and the absence of the Pu-IV-ion.

The crystallization structure of plutonyl fluoride shows a rhombic lattice with the constants $a = 5,797 \pm 0,005 \text{ \AA}$ and $42^\circ \pm 3''$.

The X-ray density of PuO_2F_2 amounts to $6,50 \text{ g/cm}^3$.
The solubility of plutonyl fluoride in water at 20°C amounts to $1,07 \text{ g/l}$. On the action of water on plutonyl fluoride a change of structure occurs. There are 5 figures, 2 tables and 7 references.

TITLE: Investigation of the Physico-Chemical Properties of Plutonyl
Fluoride (Izucheniye fiziko-khimicheskikh svoystv ftoristogo
plutonila)

PERIODICAL: Zhurnal Neorganicheskoy Khimii, 1958, Vol. 3, Nr 4, pp. 951-955 (USSR)

ABSTRACT: The synthesis of plutonyl fluoride from hydrochloric acid
solutions of plutonium-VI with liquid hydrofluoric acid
was elaborated.
The plutonyl fluoride produced by this synthesis was ana-
lyzed as follows:
a) by chemical analysis
b) by determination of the state of valence of plutonium
by means of the electron absorption spectrum
c) by the determination of the composition based on the
U. R. -absorption spectrum
d) by X-ray structural analysis.

The chemical analysis showed that plutonyl fluoride has the
following formula: PuO_2F_2 .

Yur'yev, Boris Nikolayevich, Academician

Aerodinamicheskiy raschet vertoletov (Aerodynamic Design of Helicopters)
Moscow, Oborongiz, 1956. 559 p. 5,000 copies printed.

Reviewer: Strizhevskiy, S. Ya., Candidate of Technical Sciences; Ed.: Zaytseva,
K. Ya., Engineer; Ed. of Publishing House: Petrova, I. A.; Tech. Ed.:
Zudakin, I. M.; Managing Ed.: Sokolov, A. I., Engineer.

PURPOSE: The book is a textbook for the course "Aerodynamic Design of Helicopters" given at aeronautical engineering schools. It may also be used in design offices and for helicopter operation.

COVERAGE: The book contains material necessary for practical applications, laboratory work, undergraduate and graduate projects. It gives the concepts needed for designing the aerodynamic system of a helicopter, and is aimed at obtaining a uniform and simple method of aerodynamic design. The book is based on Prof. N. Ye. Zhukovskiy's aerodynamic theories. The author names S. K. Duhevetskiy, V. P. Vetchinkin as well known in the

TITLE: Hydraulic feed-control device. Class 59, No. 188306 [announced by the Scientific Research Institute of Experimental Metalcutting Lathes (Eksperimental'nyy rauchno-issledovatel'skiy institut metallo-rezhushchikh stankov)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 21, 1966, 211

TOPIC TAGS: hydraulic device, ~~hydraulic pump~~, hydraulic pump, ~~axial pump~~ *PISTON, AXIAL PUMP*

ABSTRACT: An Author Certificate has been issued for a hydraulic feed-control device for an axial-piston pump with variable piston stroke. It contains a double-arm lever connected with the pump's control element, actuated by hydraulic control cylinders and provided with a shoulder which interacts with controllable stops in the pump's housing to limit the maximum supply. To assure a simultaneous uniform change in feeding when reversing, a controllable regulating spindle in the housing interacts through the stops with the evolvent surface of the lever's shoulder. Orig. art. has: 1 figure.
